## The 2011 CT Platinum Award Winners

In this issue, Communications Technology applauds the winners of its inaugural "Communications Technology Platinum Awards" program, recognizing and rewarding the broadband industry's most innovative hardware, software, service and market

### Cloud Software for Subscribers

### Digital Headend Equipment

#### TelVue Corporation – TelVue HyperCaster

Cable-TV providers that operate leased access channels or that run long-form advertising/infomercials are the top market for the TelVue HyperCaster, which comes in two densities: four channels in one RU or 20 channels in three RU (which will be dropping to one RU by year's end). The HyperCaster is priced at \$1,574 per channel, and it provides IP origination for as many as four independent digital broadcast channels. The server supports MPEG-2 Transport with MPEG-2 and optional H.264 video codecs in standard or high-def formats, including CableLabs and ATSC. The HyperCaster's native IP-over-Gigabit Ethernet interface can be integrated with copper or fiber IP network architectures. The HyperCaster supports PID remapping and IP StreamThru digital video switching that allows seamless switching between files on hard-drive and live-network streams, either on schedule or as default continuity, allowing the server to double as an IP digital video switcher.
